Day 1		Day 2	Day 3		Day 4	
1. HPC fundamentals & Introduction to Hazel	**2. Running jobs on Hazel**	**3. Submitting job arrays**	**4. Job performance analysis**	**5. Login node scripts with GNU parallel**	**6. Software**	**7. Data management + Globus**
• Understand Core HPC Concepts (CPU/GPU, Node/Core) • Navigate the Hazel HPC Environment • Get started with obtaining a HPC account • Learning ways to transfer files • Bonus! Basics of Unix	• Understand LSF job submission • Running an interactive job • Create a first job script and submit it • Learn some commands to monitor your jobs	• Understand the use cases for job arrays • Learn about the computation behind job arrays • Create the scripts needed to submit a job array • Create a job array and submit it	• Learn how to estimate job requirements • Analyze the performance of a job • Perform basic scaling analysis	• Understand how to run processes in the login node without causing issues • Learn about GNU parallel • Run two examples on data downloading	• Introduction to modules • Introduction to virtual environments • Introduction to containers • Learn how to load software using modules, conda, containers	Manage data across the Hazel storage system. Know when and how to use: • Research Storage (RS1) • Usrapps • Scratch • How to mount your RS1 Globus: • Understand endpoints and transfers. • Create a local and Google Drive endpoint • Perform transfers with HPC
